

Bill Impacts of Home Electrification Across the Bay Area

Building simulations that forecast real-world scenarios and inform customer choice

Shannenia Sumawan Afshin Faramarzi Yiyi Chu Justin DeBlois Farhad Farahmand

Outline

- 1. Executive Summary
- 2. Purpose
- 3. Methodology
- 4. Results
- 5. Conclusions
- 6. Appendix

Executive Summary

Throughout the Bay Area, installing heat pumps can lower customer bills TODAY.

Purpose

- 1. To better understand the bill impacts of electrifying existing homes across the Bay Area.
- 2. To enhance upon on previous studies by testing high efficiency appliances, presence of air-conditioning, and individual measures versus whole-home packages.
- 3. To develop estimates using real-world and calibrated assumptions using PCE/SVCE meter data and market-ready equipment

Approach - Homes

CPUC prototypes

- Existing cooling vs. no existing cooling
- Early Replacement (older, inefficient gas equipment) vs. End of Life Substitution (newer gas equipment)

Energy Calibration

- Whole-building consumption based on utility bill data
- Cooking and clothes drying consumption based federal data.

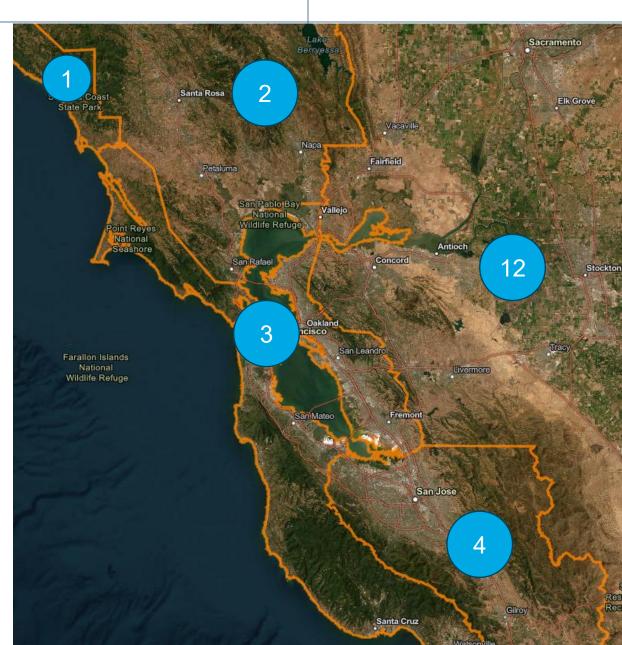

Electrification Measures

Electric cooking and clothes drying, HP water heating and HP space heating

Climates

- 1: Sonoma Coast
- 2: North Bay (e.g., Santa Rosa)
- 3: Central Bay (e.g., San Mateo, Oakland)
- 4: South Bay (e.g., San Jose)
- 12: Valley (e.g., Stockton)

Vintages: 1975 and 1985 (CZ12)

Approach - Rates

Electric (Dec 2024)

- E-TOU-C for gas homes
- E-ELEC for electrified homes

Period	E-TOU-C Electricity Rates (\$/kWh)				
Period	Peak Off-Pea				
Summer	\$0.61	\$0.50			
Winter	\$0.50	\$0.46			

Period	E-ELEC Electricity Rates (\$/kWh)					
Period	Peak	Partial- Peak	Off-Peak			
Summer	\$0.61	\$0.45	\$0.39			
Winter	\$0.38	\$0.35	\$0.34			

Gas (Jan-Dec 2024)

- G-1 for gas homes
- Average summer and winter months

Daviad	Gas Rates (\$/therms)				
Period	First 4000 Therms	Excess			
Summer	\$2.208	\$2.663			
Winter	\$2.242	\$2.701			

Both First-year and Net Present Value (NPV) bill impacts over 15 years are estimated

Results

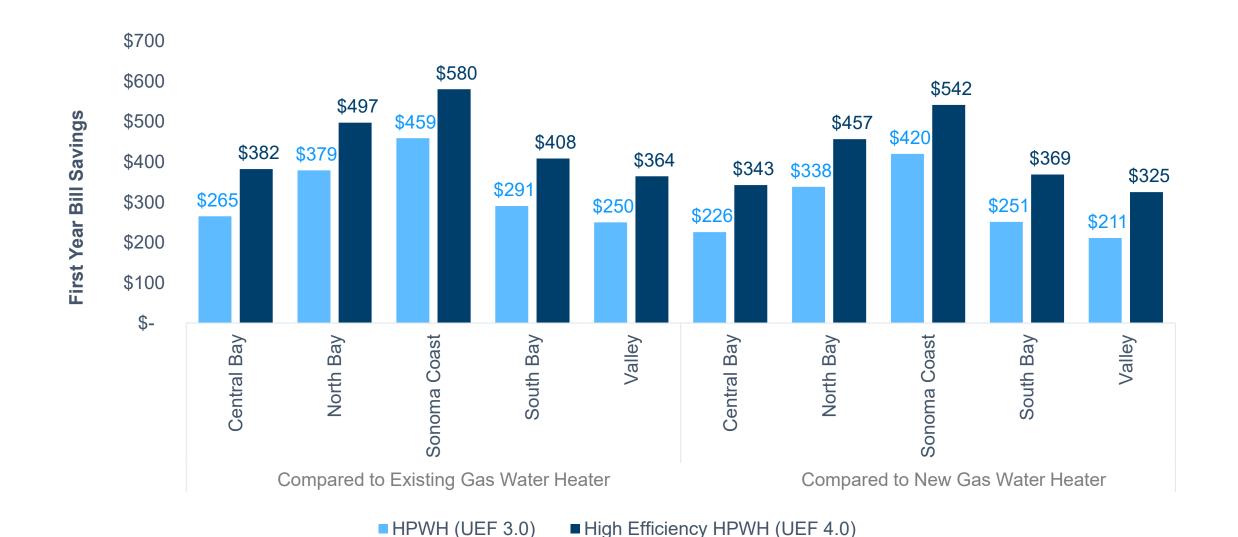

HPWHs Save \$ Today

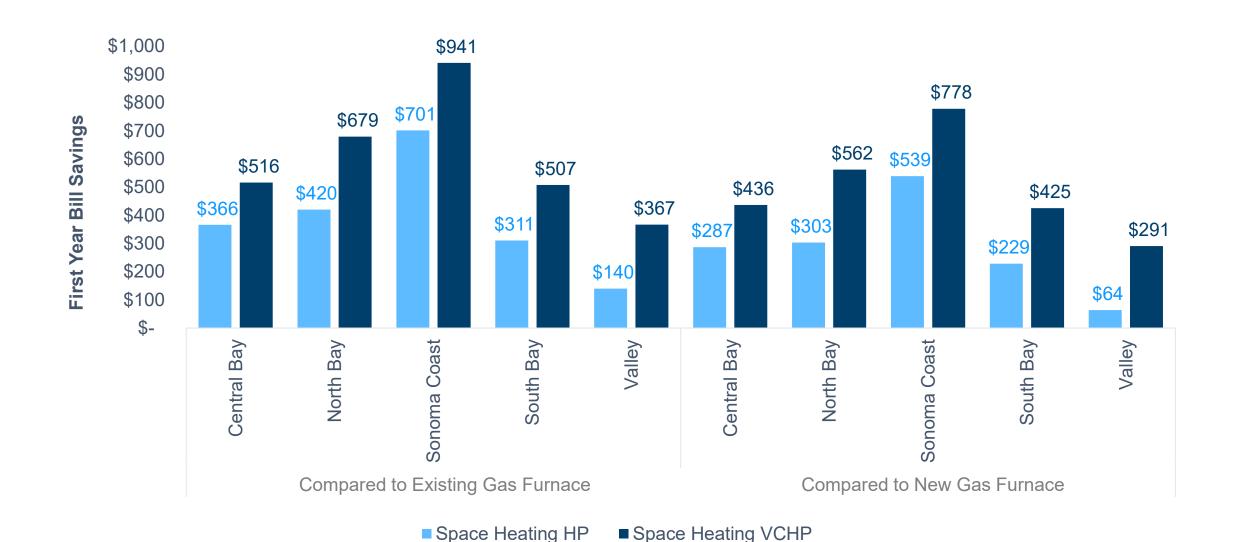

HPSHs Save \$ Today

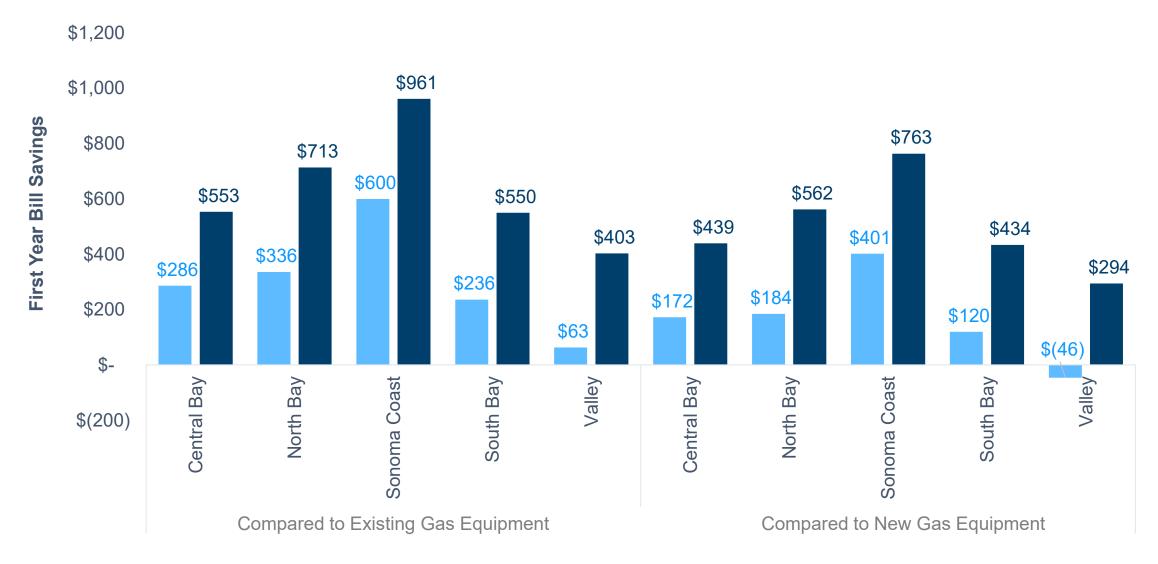

Two HPs Save \$ Today

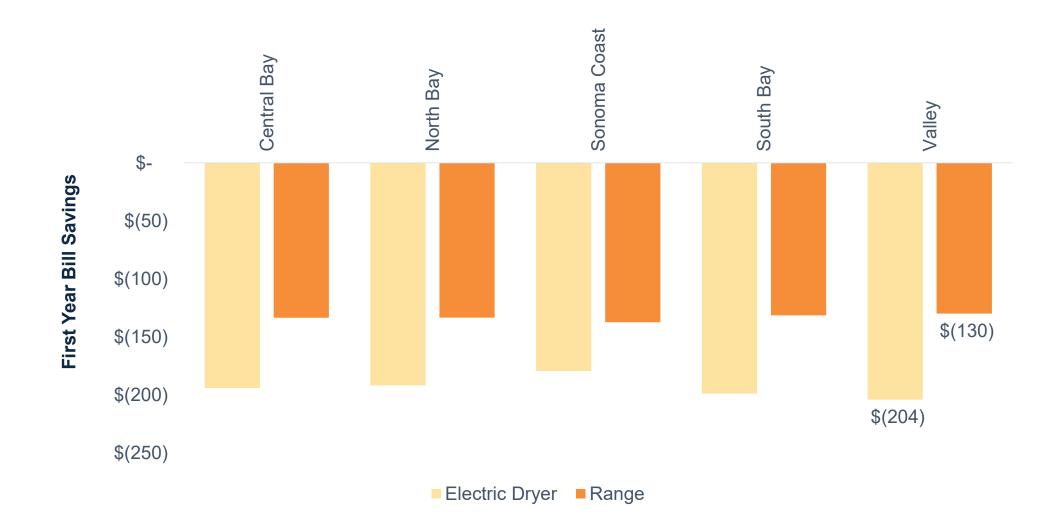

Cooking & Clothes Drying

Whole-Home Electrification

Overall (whether a home previously had A/C or not, whether comparing to existing gas equipment or new) choosing efficient appliances can lower customer bills.

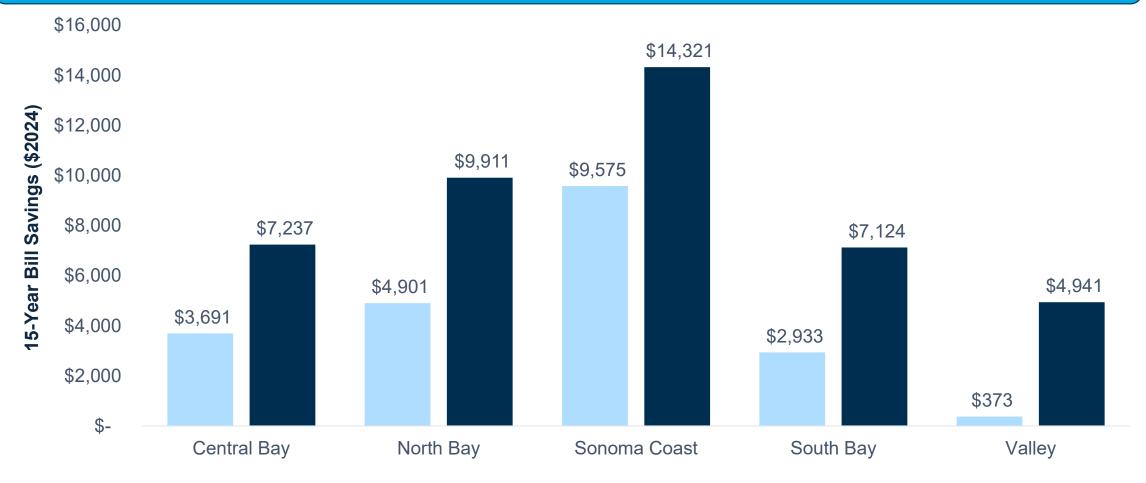

Electrification Saves \$

Whole-home electrification saves customers money over time, even with minimum efficiency equipment.

Installing high-efficiency equipment helps significantly boost long term savings.

Conclusion

Avoiding Bill Increases

Every project is unique, and simply installing a heat pump does not guarantee bill savings. Here are some common installation pitfalls to avoid to help ensure bills decrease and other factors that may increase bills.

- Customer remains on E-1 or TOU-C electricity rate after heat pumps are installed (rather than switching to EV-2 or E-ELEC).
- Heat pump is not properly programmed for efficient and/or cost-effective operation.
- Heat pump water heater is not upsized correctly and spends more time operating in electric resistance mode to meet demand.
- Variable-speed heat pump HVAC is installed with an incompatible ("non-communicating") thermostat and loses high-efficiency performance capability.
- Bill increases may be experienced when heat pumps are added as part of a larger home remodel project that increases overall electricity usage (e.g., adding new appliances, increasing square footage, purchasing an electric vehicle, etc.).
- Hotter- or colder-than-usual weather increases utility bills.

Conclusions

- Despite recent increases in electricity rates, heat pumps can help save money today for customers throughout the entire Bay Area.
- In many circumstances, whole-home electrification can lower customer bills, provided:
 - Customers install variable-speed HVAC systems
 - Electrification retrofits are paired with energy efficiency opportunities
 - Customers are enrolled in the optimum electric rate
- Homes adding AC for the first time may see slight bill increases, but this
 can be avoided with variable-speed HVAC and high efficiency HPWHs.
- Bill increases due to cooking and clothes drying can be off-set by also electrifying space and water heating.

Appendix

Methodology Comparison

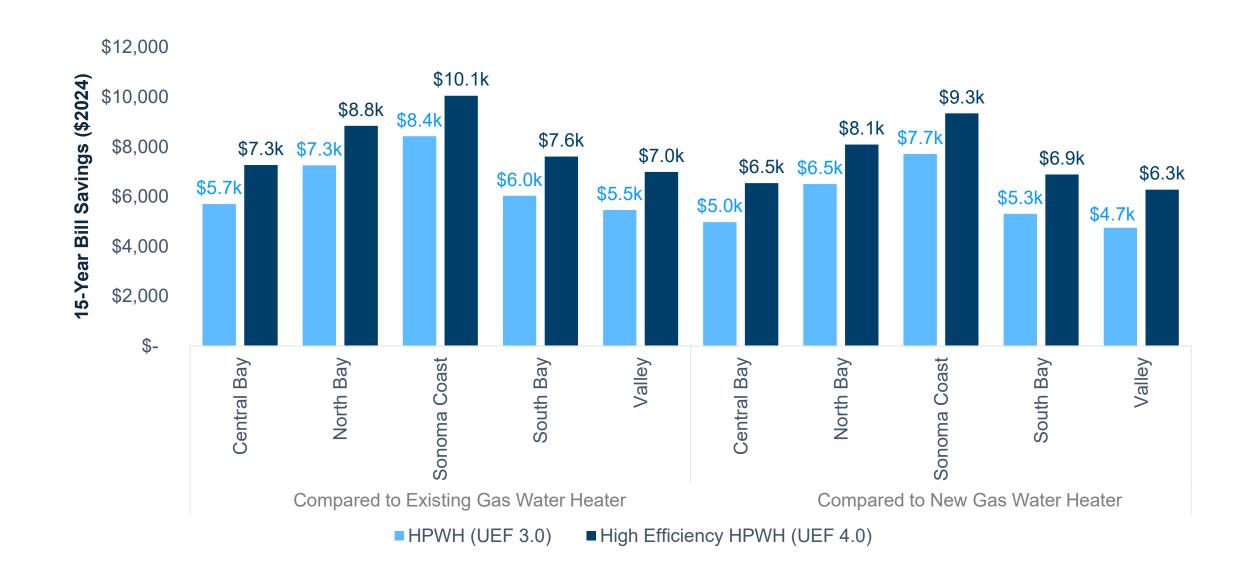

Study Design	Current On-Bill Analysis	Reach Codes Cost-Effectiveness Studies
Intent	Estimate on-bill impacts of various electrification measures	Support policy adoption of efficiency and electrification measures by passing Energy Commission cost-effectiveness criteria and avoiding federal pre-emption
	EnergyPlus - Federally developed. Full flexibility over measure settings	CBECC-Res - State developed. Limited flexibility to prevent misuse during permitting
Prototypes	Based on CPUC-approved size and vintage	Based on CEC-approved size and vintage
	Calibrated to local meter data and custom thermostat settings	Primarily based on state or federal minimum efficiency standards; generally fixed settings

HPWH Lifetime Savings

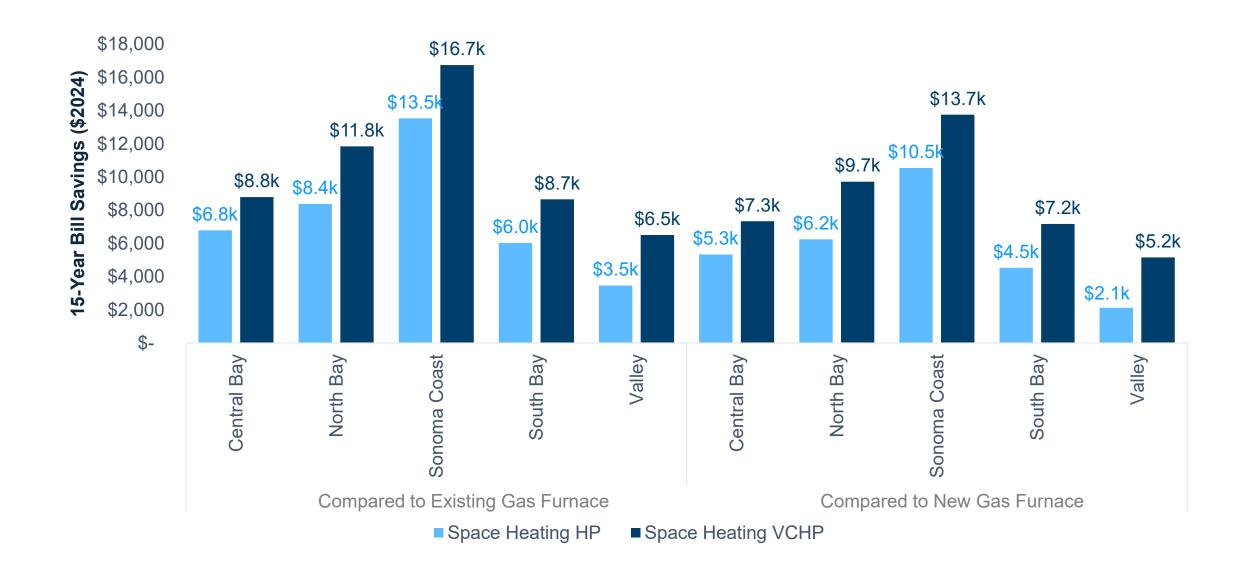

HPSH Lifetime Savings

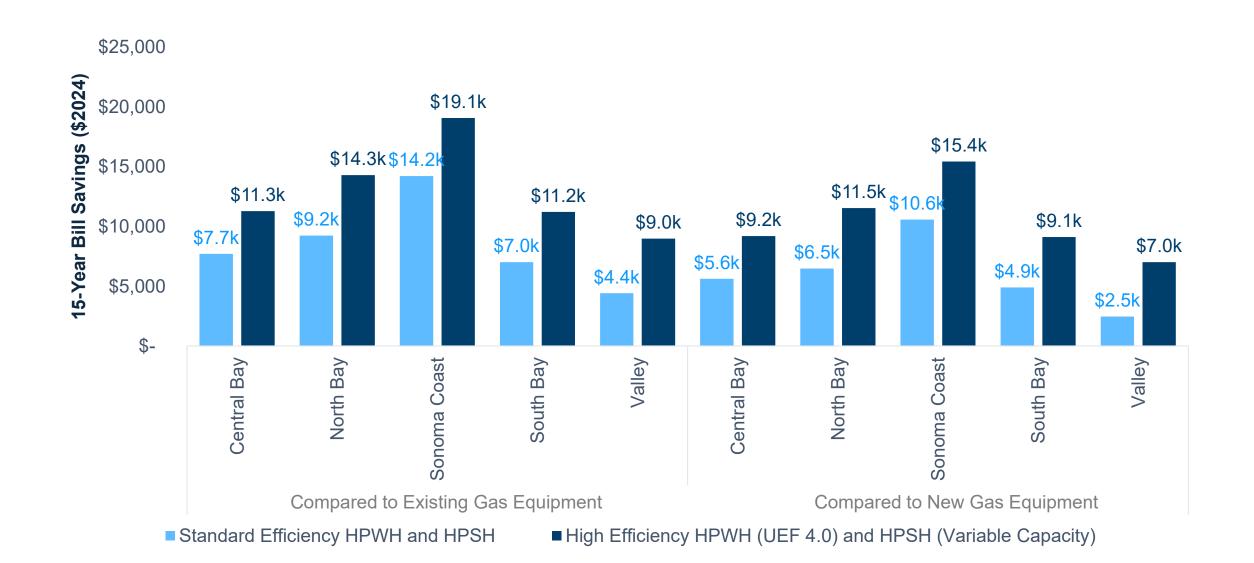

Two HPs Lifetime Savings

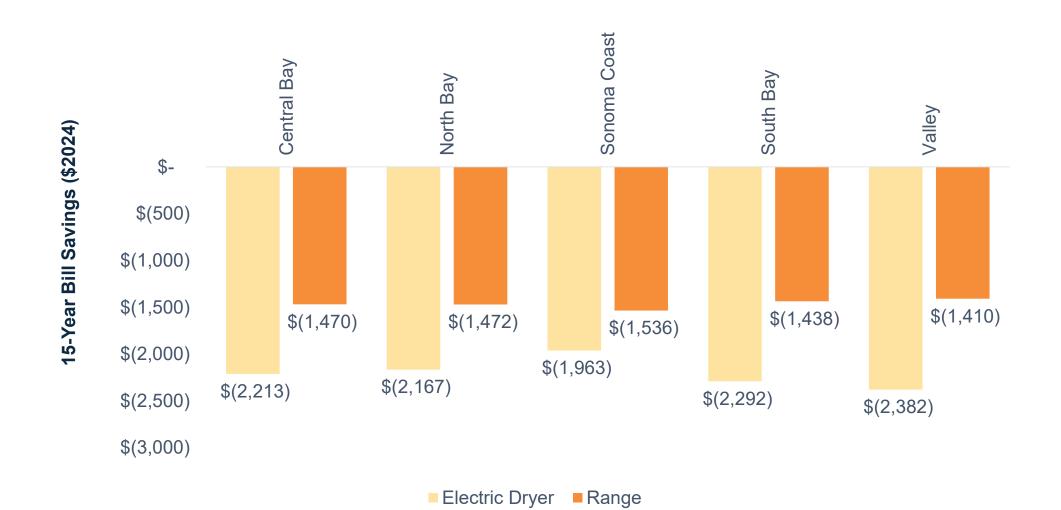

Cooking & Clothes Drying Nominally Increase Costs over 15-years

Prototype Characteristics:

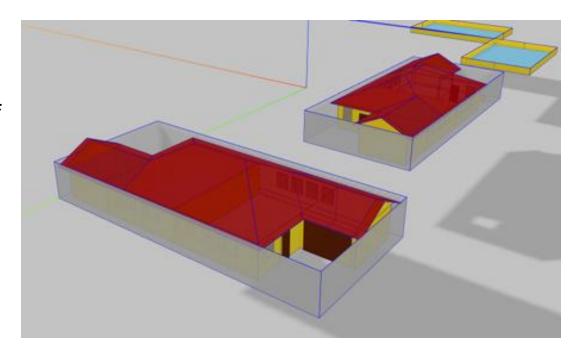

DEER Prototype including two single story building

a) Building Characteristics

- Net Conditioned floor area per building: 1,453 sf
- Total floor area per building: 1,889 sf
- People per building: 3
- Bedroom per building: 2 (assumed)

b) HVAC system

- DXGF AC (DX) with gas furnace
- NCGF No cooling with gas furnace

Cooking & Clothes Drying Data Assumptions

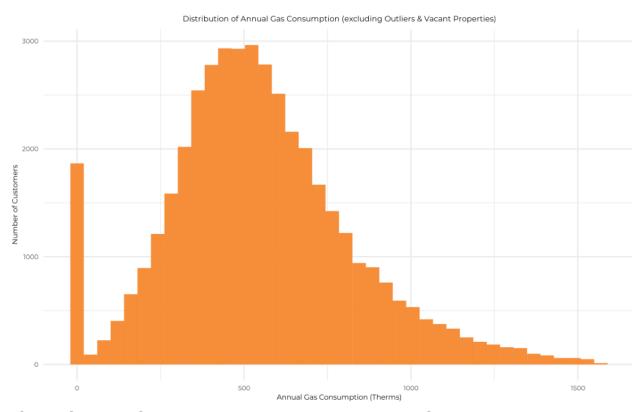

Category	Gas Baseline (kWh/yr)	Electric Measure Case (kWh/yr)
Oven	259	186
Cooktop	519	207
Clothes Dryers	615	547

• The baseline gas and electric consumption are based on the federal rated energy consumption data.

Whole Building Gas Data Comparison to Baseline

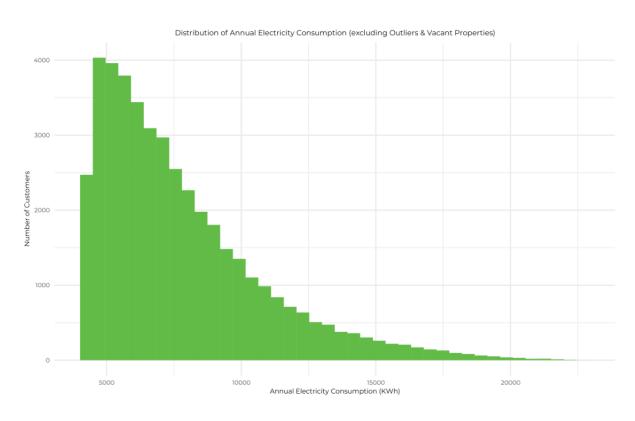

Climate Zone	Total Baseline Gas Consumption (Therms)
CZ01	531
CZ02	431
CZ03	362
CZ04	359
CZ12	334

Chart Source: Single-Family Home EUI Analysis, Silicon Valley Clean Energy, December 2024

Whole Building Electric Data Comparison to Baseline

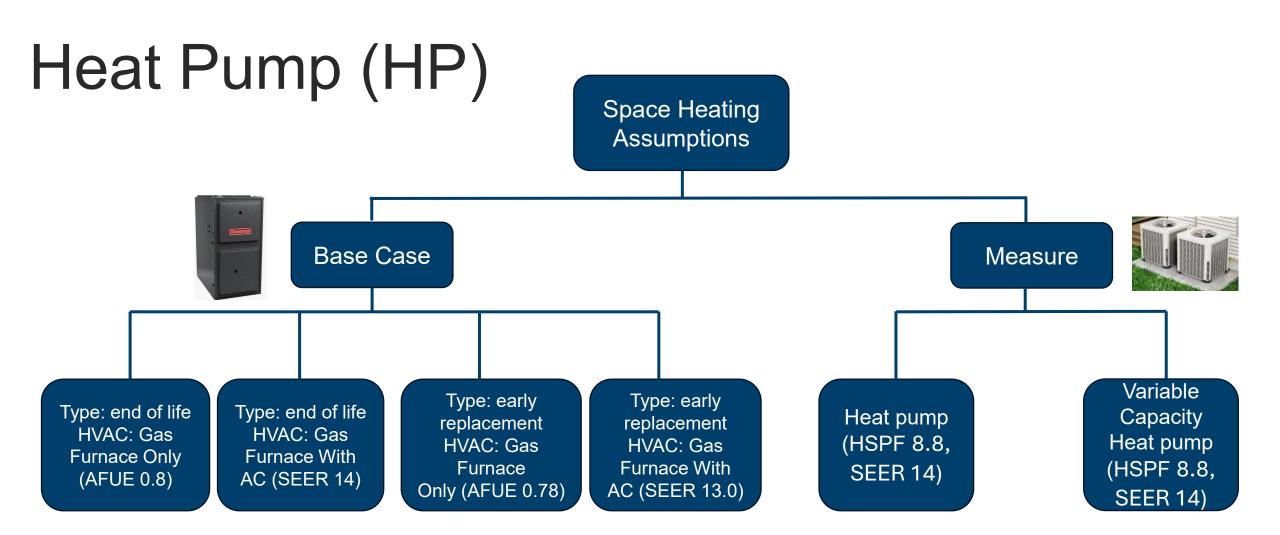

Climate Zone	Total Baseline Electricity Consumption (kWh)
CZ01	5,209
CZ02	5,396
CZ03	5,243
CZ04	5,411
CZ12	5,643

Chart Source: Single-Family Home EUI Analysis, Silicon Valley Clean Energy, December 2024

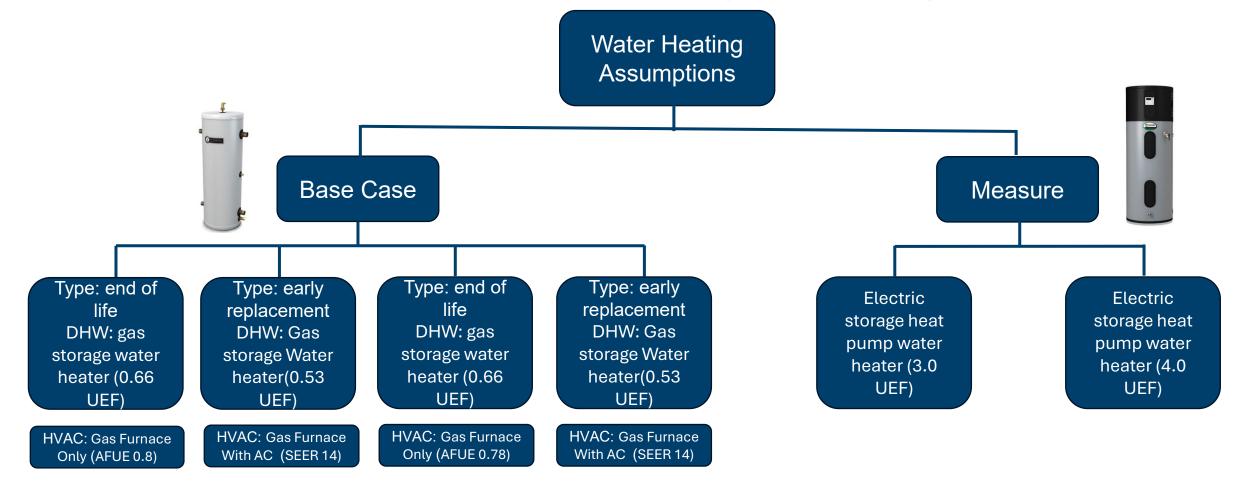

Heat Pump Water Heater(HPWH)

Modeling Approach

Baseline:

Heating : Ducted gas furnace.

Cooling : DX cooling/No Cooling

DHW :Gas Storage Water Heater

Measures

Heating : Heat Pump

Cooling : Heat Pump

o DHW : Heat Pump

Parameters related to each baseline and measure case are defined in the cases and cohort files.
